**Flash survey on SARS-CoV-2 variants in urban wastewater in Italy**  
**14<sup>th</sup> Report**  
**(Study period: October 3rd to 7th, 2022)**

---

**Edited by:**

- Giuseppina La Rosa, Giusy Bonanno Ferraro, Pamela Mancini, Carolina Veneri, Lidia Orlandi, Claudia Del Giudice, Marcello Iaconelli, Luca Lucentini (Department of Environment and Health, Istituto Superiore di Sanità)
- David Brandtner (independent researcher)
- Mauro Grigioni (National Center for Innovative Technologies in Public Health, Istituto Superiore di Sanità)
- Mirko Rossi (independent researcher)
- Elisabetta Suffredini (Department of Food Safety, Nutrition and Veterinary Public Health, Istituto Superiore di Sanità)

### Main findings:

- During the week of October 3rd to 7th, 2022, a total of 164 wastewater samples were collected from 18 Regions and 2 Autonomous Provinces.
- The characteristic mutations of the Omicron variant were detected in 14 Regions/Autonomous Provinces, while no sequences were obtained from the remaining regions.
- Of the sequences obtained, 81.4% showed amino acid substitutions of sublineage BA.4/5, 9.3% of BA.4/5 + R346T, 2.3% of BQ.1, and 2.3% of BQ.1.1.
- NGS results confirmed the widespread presence of sublineages BA.4/BA.5 across the majority of the regions/provinces and also confirmed the circulation of sublineages BA.4/5 + R346T, BQ.1 and BQ.1.1.

### Introduction

On March 17th, 2021, the European Union Commission issued Recommendation 2021/472, encouraging Member States to establish a systematic surveillance of SARS-CoV-2 and its variants in wastewater by October 1st, 2021. In response to this recommendation, the Istituto Superiore di Sanità (ISS) initiated "flash surveys", which are periodic, monthly sampling campaigns conducted at various locations throughout Italy over a short period of time. The purpose of this report is to provide a summary of the findings from the 14th national Flash Survey on SARS-CoV-2 variants in wastewater samples in Italy, conducted from October 3rd to October 7th, 2022.

### Methodology

The survey involved the collection of 164 sewage samples from 161 wastewater treatment plants (WTPs) located across 18 Regions and 2 Autonomous Provinces during the period from October 3rd to October 7th, 2022. Information on the WTPs participating in the SARS-CoV-2 surveillance in urban wastewater in Italy can be found on the ISS website<sup>1</sup>. The samples were processed and the viral concentration was determined by the SARI network laboratories using the protocol "Sorveglianza di SARS-CoV-2 in reflui urbani - Protocollo progetto SARI - rev.3"<sup>2</sup>. The purified RNAs were then sent to ISS for variant detection using both Sanger and NGS methods.

A real-time RT-PCR assay was used to screen for the presence of the Omicron variant<sup>3</sup>. A long nested RT-PCR assay (~1600 bps, spanning amino acid residues 58 to 573 of the spike protein) was used to detect multiple nucleotide changes distinctive of Variants of Concern (VoCs) and Variants of Interest (Vols) in the spike protein<sup>4</sup>. Amplicons from the long nested assay were sequenced using both Sanger (single samples) and Next Generation Sequencing (NGS) (pools by Regions/AP) with the Oxford

Rapid screening for SARS-CoV-2 variants of concern in clinical and environmental samples using nested RT-PCR assays targeting key mutations of the spike protein, *Water Research*, 2021, Volume 197, 1 June 2021, 117104. <https://doi.org/10.1016/j.watres.2021.117104>.

Nanopore Technology MinION platform. Bioinformatics analysis was carried out and variant calling was performed for recognized VoCs as previously described<sup>5</sup>.

To differentiate between the Omicron sublineages BA.4 and BA.5, which have identical spike proteins in the sequenced region, a nested PCR was carried out to detect a mutation in the M gene at position D3 (BA.5 has the D3N mutation).

## Results

In total, 158 out of 164 samples (96.3%) tested positive for SARS-CoV-2 using the real-time RT-qPCR method adopted for environmental surveillance (Table 1). The viral concentrations ranged from 4.13 E+02 to 1.09E+06 genome copies (g.c.) per liter of sewage. Additionally, 152 out of the 164 (92.6%) samples tested positive for the Omicron variant through the RT-qPCR assay, with cycle threshold (CT) values ranging from 30.1 to 39.7.

### Sanger Sequencing

The real-time PCR assays, long nested PCR, and sequencing results are summarized in Table 1. A total of 45 samples from 14 Regions/Autonomous provinces were amplified by the long nested PCR assay, but long amplicons could not be obtained from samples collected in the regions of Abruzzo, Basilicata, Campania, Molise, Sicily, and Umbria. High quality Sanger sequences were obtained from 43 samples, while one sample resulted in mixed electropherograms due to the simultaneous presence of more than one strain. One sequence was unsuccessful due to a high background or noisy sequencing signal. All amplicons were characterized as the Omicron variant through Sanger sequencing.

Specifically, the Omicron BA.4/5 sublineage (which is characterized by the amino acid substitutions L452R and F486V in addition to those typical of BA.2) was detected in 35 samples (81.4%) from 14 Regions/Autonomous Provinces, such as Calabria, Emilia-Romagna, Friuli-Venezia Giulia, Lazio, Liguria, Lombardia, Marche, Piemonte, Puglia, Toscana, Valle d'Aosta, Veneto, Autonomous Provinces of Bolzano, and Trento. Four samples (9.3%) were characterized as the sublineage BA.4/5 + R346T mutation. Only one sample presented the key mutations of BQ.1 (characterized by the amino acid substitutions K444T and N460K in addition to those typical of BA.4/5) and another sample showed the characteristic mutations of BQ.1.1 (characterized by the amino acid substitutions R346T, in addition to those typical of BQ1). In two samples (4.65%), the presence of double peaks in correspondence to the spike mutation sites 1038, 1332, and 1380 (corresponding to the aminoacids R346, K444, and N460, respectively) suggested the simultaneous presence of more than one sublineage in different combinations (BA.4/5, BA.4/5 + R346T, BQ.1, or BQ.1.1) in these samples.

Using the assay targeting the M gene, 33 out of 35 samples were assigned to the Omicron BA.5 subvariant (due to the presence of the D3N mutation). Only two samples showed the presence of both subvariants BA.4 and BA.5 (indicated by a double A/G peak in correspondence to the mutation site).

### Next Generation Sequencing

NGS results were successfully obtained for all tested Regional pools, which showed the defining mutations of the Omicron variant (Table 1).

For ease of reading, the mutations were grouped into panels ('mutation packages') as follow:

- **Package C** (Omicron BQ.1, long fragment from PCR ID\_980) = DEL69/70, G142D, V213G, G339D, S371F, S373P, S375F, T376A, D405N, R408S, K417N, N440K, **K444T**, **L452R**, **N460K**, S477N, T478K, E484A, **F486V**, Q498R, N501Y, Y505H
- **Package D** (Omicron BQ.1.1, long fragment from PCR ID\_980) = DEL69/70, G142D, V213G, G339D, **R346T**, S371F, S373P, S375F, T376A, D405N, R408S, K417N, N440K, **K444T**, **L452R**, **N460K**, S477N, T478K, E484A, **F486V**, Q498R, N501Y, Y505H

The key mutations of the Omicron sublineage BA.4/5 (Package A) were found in 14 Regions/AP in Italy: Calabria, Emilia Romagna, Friuli-Venezia Giulia, Lazio, Liguria, Lombardia, Marche, Piemonte, Puglia, Toscana, Valle d'Aosta, Veneto, and the A.P. of Bolzano and Trento. The key mutations of the Omicron sublineage BA.4/5 + R346T (Package B) were detected in seven Regions/AP: Emilia Romagna, Friuli-Venezia Giulia, Liguria, Puglia, Veneto, Trento, and Bolzano. The amino-acid substitutions of the sublineage BQ.1 (Package C) were found in Emilia Romagna, Puglia and Veneto. The sublineage BQ.1.1 (Package D) was detected in Emilia Romagna, Puglia, Veneto, and A.P Trento.

\* Upon testing for the assay targeting the M gene, of the 35 BA.4/BA.5 sequences, 33 were assigned to Omicron BA.5, and 2 showed the presence of both sublineages.

## **Limitations of the study**

The geographical and population coverage of this flash survey was incomplete, as it covered 20 out of 21 of the Italian regions/Autonomous Provinces.

The molecular analytical methods used for complex environmental matrices, such as wastewater, can be hindered by low viral concentrations, poor analyte recovery, and/or PCR amplification inhibition. As a result, both detection/quantification and PCR amplification for sequencing may produce false negatives, making it difficult to achieve molecular characterization and variant detection for all samples.

Partial sequencing of the Spike region does not provide conclusive results for sublineage assignment. However, the detection of defined mutation panels that are characteristic of certain lineages/sublineages, through Sanger or NGS sequencing, should be considered as a presumptive detection.

## **Conclusions and final considerations**

This report is part of a monthly series on SARS-CoV-2 and its variants in wastewaters in Italy, as established by the EU Commission Recommendation 2021/472. The aim is to provide additional information on SARS-CoV-2 variants in the population, supplementing information gathered through clinical surveillance. The results indicate that the Omicron variant is the sole presence of SARS-CoV-2 in Italy, with the sublineage BA.5 being the most prevalent. However, mutations characteristic of sublineages Omicron BA.4/5 + R346T, BQ.1, and BQ.1.1 were also detected.

The sequencing of SARS-CoV-2 in wastewater provides additional information to the sequencing of clinical cases, allowing for a more accurate description of the circulating variants in the country.

## Acknowledgements

We thank all of the members of the SARI network ("Sorveglianza Ambientale di SARS-CoV-2 attraverso i Reflui urbani in Italia") for the cooperation in sample collection and processing, data gathering and management, organization and logistic support. The SARI network includes:

- **Abruzzo:** Giuseppe Bucciarelli, Paolo Torlontano (Regione Abruzzo); Giuseppe Aprea, Silvia Scattolini, Silvia Scattolini, Daniela D'Angelantonio, Giacomo Migliorati (Istituto Zooprofilattico Sperimentale dell'Abruzzo e del Molise "G. Caporale");
- **Basilicata:** Michele La Bianca (Regione Basilicata); Rosa Anna Cifarelli, Achille Palma, Giovanna La Vecchia e Giuseppe Lauria (Agenzia Regionale per la Protezione dell'Ambiente Basilicata – ARPAB); Rosanna Brienza e Patrizia Montenegro (Acquedotto Lucano-AQL);
- **Calabria:** Eduardo Malacaria (Regione Calabria), Giuseppe Folino, Michelangelo Iannone, Filomena Casaburi, Giorgia Bulotta, Emanuela Barillari, Melania Dragone, Iolanda Sacco, Carmine Tomaino, Cristina Felicetta, Adelaide Calabria, Ottavia Varcasia, Francesca Stefanizzi, Concetta Vizza (Arpacal);
- **Campania:** Angelo D'Argenzo (Regione Campania); Luigi Cossentino, Renato Olivares (Arpac - Agenzia Regionale per la Protezione Ambientale in Campania); Antonio Pizzolante, Giovanna Fusco (Istituto Zooprofilattico Sperimentale del Mezzogiorno); Alessandra Tosco, Amalia Porta (Università degli Studi di Salerno); Francesca Pennino, Triassi Maria (Università degli Studi di Napoli "Federico II");
- **Emilia Romagna:** Paola Angelini, Lisa Gentili (Regione Emilia – Romagna); Laura De Lellis, Daniele Nasci (HERATech); Giovanni Alborali; Nicoletta Formenti, Flavia Guarneri (Istituto Zooprofilattico Sperimentale della Lombardia e dell'Emilia-Romagna); Nadia Fontani, Giulia Nani, Franca Palumbo, Gianluca Borlone, Marco Guercio (IREN);
