

# Virological surveillance

## RespiVirNet

**Report for week 13/2024**  
(25<sup>th</sup> – 31<sup>st</sup> March 2024)

### Summary

The present report summarizes the results obtained in the context of the virological surveillance activities in Italy, coordinated by the National Influenza Centre (NIC) laboratory at ISS, in collaboration with a network of 24 regional influenza laboratories (RespiVirNet).

During the thirteenth week of 2024 (**week 13/2024**) of virological surveillance, 1,708 clinical specimens were received by the RespiVirNet network laboratories and **42 (2.4%)** resulted positive for influenza. Among these samples, 8 belonged to influenza type **A** (3 were **H1N1pdm09**, 2 were **H3N2** and 3 not yet subtyped) and 34 to influenza type **B**.

Overall, the circulation of respiratory viruses continued to decline. In particular, among the above analyzed samples, 42 (2.4%) resulted positive for **RSV**, 13 (0.7%) for **SARS-CoV-2** and the other 288 were attributed to other respiratory viruses, in particular 104 Rhinoviruses, 82 Metapneumoviruses, 35 human Coronaviruses (not SARS-CoV-2), 30 Parainfluenza viruses, 25 Adenoviruses and 12 Bocavirus.

During this week, five samples resulted positive for *Mycoplasma pneumoniae*.

So far, in the 2023/2024 influenza season (week 46/2023-13/2024), a prevalence of influenza type A viruses has been observed, mostly belonging to the H1N1pdm09 subtype. In particular, among a total of 54,165 collected samples, 7849 (14.5%) resulted positive for influenza, of which 7,257 (92.5%) were positive for influenza A and 592 (7.5%) for influenza B.

Among the influenza A viruses that were subtyped (N=6,222), 94.9% (N=5,904) were A(H1N1)pdm09 and 5.1% (N=318) were A(H3N2); the remaining 1,035 A strains have not been subtyped yet.

Additional information and data for this report may be found in the full Italian version.
